An Alternative in Prostate Cancer Diagnosis
Prostate MRI Screening

Insight Imaging now offers Prostate MRI to assist providers in identifying suspicious areas of the prostate in patients with elevated or rising prostate-specific antigen (PSA).

BENEFITS OF PROSTATE MRI SCREENING
Prostate MRI screening complements PSA tests by identifying specific areas within the prostate gland that are suspicious and require further investigation.

- Allows for early detection and evaluation of prostate abnormalities
- 3T MRI allows for clearer, more detailed images of the prostate and other pelvic structures without the need for an endorectal coil
- Safe, non-invasive exam — no patient preparation, coil or radiation exposure
- Assists in determining next steps and treatment plans for patients

CANDIDATES FOR PROSTATE MRI SCREENING
- Elevated or rising prostate-specific antigen (PSA) and at least one negative transrectal ultrasound-guided (TRUS) biopsy
- Positive digital rectal exam (DRE) and negative TRUS biopsy
- Prostate cancer diagnosis—to provide accurate staging and guide treatment options or assess disease progression
- Prostate cancer—to assess recurrences following radical prostatectomy or radiation therapy

Our radiologists are part of a prostate screening peer review program in collaboration with specialized radiologists at the Medical College of Wisconsin, with nearly 20 years of experience.
